Art Unit: 2861

DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-4 and 9-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takizawa et al. (US Patent 6,357,849) in view of Yoshiyama et al. (US 2002/0140750).
- 3. Takizawa discloses a device manufacturing apparatus (20 in figure 14) comprising:
 - Claim 1:

a discharge head (36 in figure 14) for discharging a droplet containing a functional material;

a stage (26 in figure 14) for supporting a substrate on which said droplet is discharged, and which is capable of moving relative to said discharge head (subscanning direction in figure 14);

a carrier (24 in figure 14) for carrying said substrate;

a detector (40 in figure 14) for detecting a discharge condition of said droplet which is discharged from a discharge nozzle formed in said discharge head;

a driving device (28 in figure 14) for moving said discharge head with respect to said detector (column 10, lines 54-59); and

a controller (54 in figure 16) for executing a detection operation by said detector during loading and unloading operations of said substrate (the paper is fed [loaded and unloaded] between printing swaths (col.7, lines 48-53) and the detection of malfunctioning nozzles takes place between said swaths (col.15, lines 18-38)), wherein said detector and said stage are provided at different locations (as seen in figures 14 and 15; column 10, lines 66-67).

Thus Takizawa et al. discloses the claimed limitations as set forth above except "said loading and unloading operations being made by replacing a first substrate being the substrate currently supported on the stage with a second substrate being another substrate not supported on the stage."

Yoshiyama et al. discloses a calibration process in an inkjet printer that conducts ink detection during a paper-discharging period (defined as the interval after printing has been completed and the recording sheet is discharged) so that the detection can be made prior to feeding the next sheet of recording paper. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the Takizawa et al. invention to include means for conducting detection steps during loading and unloading operations as taught by Yoshiyama et al. for the purpose of improving printing speed.

Art Unit: 2861

4. Takizawa further discloses a device manufacturing apparatus:

• Claim 2:

said detector comprising:

a light emitter (40a in figure 14) for emitting a detection light; and

a receiver (40b in figure 14) for receiving said detection light emitted from said light emitter (40a);

wherein said receiver (40b) determines whether said droplet is being discharged from said discharge nozzle, based on changes in the intensity of said detection light received by said receiver due to said liquid passing through the optical path of said detection light (column 13, lines 32-36).

Claim 3:

wherein said controller performs calibration of said receiver at a predetermined timing (column 8, lines 3-8).

Claim 4:

further comprising:

a recovery unit for performing a recovery operation of said discharge nozzle (column 9, lines 10-15).

• Claim 9:

wherein said device is at least one of; a liquid crystal element, an organic electroluminescent element, a plasma display element, an electron emission element, an optical element and a conductive film element (the device produced by Takizawa et al. is so-called "optical element").

Art Unit: 2861

5. Takizawa discloses a device manufacturing method comprising:

Claim 10:

a step of discharging a droplet containing a functional material onto a substrate by means of a discharge nozzle (Abstract) in a discharge head (36 in figure 14; column 10, lines 51-53);

a carrying step of loading and unloading said substrate (column 10, lines 54-57);

a step of moving said discharge nozzle from a position at which said step of discharging said droplet is carried out, to a second position at which an operation for detecting a discharge condition of said droplet which is discharged from said discharge nozzle is carried out, during said carrying step (from the "printing area" to the "adjustment area" in figure 15); and

a detection step of detecting said discharge condition during said carrying step (column 13, lines 25-36).

Thus Takizawa et al. discloses the claimed limitations as set forth above except "in which a first substrate being the substrate currently positioned at the first position is replaced with a second substrate being another substrate currently not positioned on the first position.

Yoshiyama et al. discloses a calibration process in an inkjet printer that conducts ink detection during a paper-discharging period (defined as the interval after printing has been completed and the recording sheet is discharged) so that the detection can be made prior to feeding the next sheet of recording paper. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the

Art Unit: 2861

Takizawa et al. invention to include means for conducting detection steps during loading and unloading operations as taught by Yoshiyama et al. for the purpose of improving printing speed.

- 6. Takizawa further discloses a device manufacturing method:
 - Claim 11:

the steps of:

emitting detection light towards a receiver; and

determining whether said droplet is being discharged from said discharge nozzle, based on changes in the intensity of said detection light received by said receiver due to said droplet passing through the optical path of said detection light (col. 13, lines 25-36).

Claim 12:

wherein calibration of the receiver is performed at a predetermined timing (column 8, lines 3-8).

- 7. Claims 5 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takizawa et al. (US Patent 6,357,849) in view of Yoshiyama et al. (US 2002/0140750) and further in view of Bruch et al. (US Patent 6,814,422).
 - Claim 5:

Takizawa et al. in view of Yoshiyama et al. discloses the claimed limitations as set forth above except "wherein said controller performs said recovery operation corresponding to detection results of said detector, and reexecutes detection a predetermined number of times."

Page 7

Art Unit: 2861

Bruch et al. discloses a method of servicing a printhead, comprising a drop detection step and a nozzle recovery step controlled by a controller wherein the "step of performing automatic printhead intervention is initiated if, during a last fixed number of drop detections, the number of bad nozzles was greater than the threshold level.

Preferably the fixed number of previous drop detections may be 8, 16, or 64 (column 15, lines 19-23)."

It would have been obvious to one of ordinary skill in the art at the time of the invention to include a drop detector that reexecutes detection a predetermined number of times. One would have been motivated to modify Takizawa et al. in view of Yoshiyama et al. to improve print quality as taught by Bruch et al.

Claim 8:

Takizawa et al. in view of Yoshiyama et al. discloses the claimed limitations as set forth above except "wherein said discharge head is two or more". Takizawa et al. teaches a printhead (36 in figure 17) with a row of nozzles each different color (as seen in figure 17).

Bruch et al. discloses a carriage (40 in figure 2) positioned with the pens (50, 52, 54, 56 in figure 2) ready to be serviced by a replaceable printhead cleaner service station system (70 in figure 1).

It would have been obvious to one of ordinary skill in the art at the time of the invention to include a carriage positioned with two or more printheads. One would have been motivated to modify Takizawa et al. in view of Yoshiyama et al. to make printhead replacement easier as taught by Bruch et al.

8. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Takizawa et al. (US Patent 6,357,849) in view of Yoshiyama et al. (US 2002/0140750) and further in view of Hah (US Patent 6,371,590).

Takizawa et al. discloses the claimed limitations as set forth above except "further comprising a display device for displaying detection results of said detector, and an error based on the detection results."

Hah teaches a display device that displays "an error message when at least one nozzle is malfunctioning, the quantity of malfunctioning nozzles in the printhead, the quantity of functioning nozzles in the printhead and which individual nozzles are malfunctioning, if any (column 5, lines 5-14)."

It would have been obvious to one of ordinary skill in the art at the time of the invention to provide a printing system with droplet detection means and a display device for displaying detection results. One would have been motivated to modify Takizawa in view of Yoshiyama et al. in order to discover the presence of malfunctioning nozzles as taught by Hah.

9. Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Takizawa et al. (US Patent 6,357,849) in view of Yoshiyama et al. (US 2002/0140750) and further in view of Cleary et al. (US 2002/0149660).

Takizawa et al discloses a method for manufacturing a device comprising:

loading a first substrate (paper P in fig.14) onto a stage (26 in fig. 14; in the subscanning direction as seen in fig.14);

Application/Control Number: 10/691,464

Art Unit: 2861

discharging droplets onto the first substrate from a nozzle (Abstract) in a discharge head (36 in fig. 14; col.10, lines 51-53);

unloading said first substrate from the stage (as seen in fig.14); and during the loading or unloading, testing the discharge head by passing droplets therefrom through a light beam (by light emitter 40a in figure 14; the paper is fed [loaded and unloaded] between printing swaths (col.7, lines 48-53) and the detection of malfunctioning nozzles takes place between said swaths (col.15, lines 18-38)).

Thus, Takizawa et al. teach all the claim limitations as set forth above except "during the loading of a second substrate not positioned on the stage, onto the stage or unloading of the first substrate positioned on the stage."

Yoshiyama et al. discloses a calibration process in an inkjet printer that conducts ink detection during a paper-discharging period (defined as the interval after printing has been completed and the recording sheet is discharged) so that the detection can be made prior to feeding the next sheet of recording paper. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the Takizawa et al. invention to include means for conducting detection steps during loading and unloading operations as taught by Yoshiyama et al. for the purpose of improving printing speed.

Furthermore, Takizawa et al. fails to disclose "treating the droplets to form a structure on the substrate".

Cleary et al. disclose "an apparatus for setting radiation curable ink deposited onto a substrate. The apparatus includes a series of ink jet printheads, which deposit

ink onto the substrate, and a radiation source mounted laterally to the series of ink jet print heads (Abstract)." The substrate (32 in fig. 11) is fed through the printing system (in the direction of arrow A in fig. 11), receives ink from the printheads and is moved to the curing station (200 in fig.11; page4, paragraph 0045).

It would have been obvious to one of ordinary skill in the art at the time of the invention to provide means for treating the droplets after being deposited on the substrate to form a structure. One would have been motivated to modify Takizawa et al. in view of Yoshiyama et al. in order to dry and cure the ink and obtain better print quality as taught by Cleary et al.

Response to Arguments

Applicant's arguments with respect to claims 1, 10 and 15 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Communication with the USPTO

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jannelle M. Lebron whose telephone number is (571) 272-2729. The examiner can normally be reached on Monday thru Friday 8:30am-5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen D. Meier can be reached on (571) 272-2149. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Application/Control Number: 10/691,464
